Support structure

It is made up of three longitudinal cross-bars in light grey painted steel which are fixed at the bed foot and sides.

The slatted base

It is made up of specially treated, grey lacquered beech plywood and finished with joint elements at the angles and n. 26 slats in precurved beech plywood. The top face of the slats is treated with anti-slip finish. The slats are mounted on the frame through elastic slat caps to guarantee a high level of flexibility.

In the head/foot area, shaped slats allow a perfect support of the mattress and in the shoulders area, the shaped slats offer the maximum of elasticity and comfort. In the pelvis area, where 42% of our weight is concentrated, cursors allow the elasticity of the slats. Pollutant glues have been totally excluded at the manufacturing stage.

The sprung base

It's a bit like a mattress supporting another mattress. A frame in solid fir-wood covered in special material, holds up the surface made up of a system of padded steel springs with a resistant cloth covering. It distributes our weight along the entire surface. The base is fix. Pollutant glues have been totally excluded at the manufacturing stage.

Sprung mattresses

They are perfect for the sprung base. Only the weighted springs enter into action depending on the degree of pressure placed on it. In this type of mattress is guranteed the required airing.

Latex mattresses

They are light, hygienic, longlasting, classical. They adapt perfectly to the slatted base. The elastic support has been studied in such a way as to allow a perfect airing.

Length of mattresses 79"

Total width of mattresses

Queen 63"
King 79"

No. of mattresses

1 or 2 x 31.5"
2 x 39.5"

Type and no. of bases

Slats 2 x 31" 2 x 39"
Sprung 2 x 30.7" 2 x 38.5"

Under our weight the slat caps adapt themselves perfectly to the shape of our body, gently holding it up.
